Repeat Delivery Subscription and Recurring Billing Terms

Document ID: MP-AUTO | Merchant: MaplePaw Pet Supply Canada | Version: 1.0

Effective date: 2026-10-08 | Region: Fictional Canadian storefront | Currency: CAD

Document status: Original synthetic merchant policy for software testing.

Repeat Delivery is an invented recurring-order program for physical pet supplies. Its notice periods, cutoff times, discount and consent rules are original test settings. This document is not the Autoship terms of Chewy, an actual subscription contract or a rule determining the outcome of a provider dispute.

Contents

MP-AUTO-01. Program purpose and absence of a membership fee

MP-AUTO-02. Enrolment and recurring consent

MP-AUTO-03. Schedule, processing boundary and time calculation

MP-AUTO-04. Upcoming-order notice

MP-AUTO-05. Prices, discounts and authorized cycle totals

MP-AUTO-06. Payment authorization and capture

MP-AUTO-07. Cancelling the schedule and the current order

MP-AUTO-08. Skipping, pausing and resuming

MP-AUTO-09. Changing dates, quantities and products

MP-AUTO-10. Out-of-stock items and substitutions

MP-AUTO-11. Physical goods, returns and delivery claims

MP-AUTO-12. Cancelled recurring billing complaint investigation

MP-AUTO-13. Confirmation errors and delayed support handling

MP-AUTO-14. Record retention and review access

MP-AUTO-15. Policy changes and program termination

MP-AUTO-16. Timeline examples

MP-AUTO-01. Program purpose and absence of a membership fee

Repeat Delivery lets the customer schedule recurring purchases of selected food, treats and other eligible consumable supplies. Each cycle creates a separate physical-goods order with its own total, fulfilment records and payment transactions. The schedule itself is not a paid membership or a digital service.

There is no enrolment fee, membership fee or separate cancellation fee in this version. The customer pays for the confirmed goods, any disclosed delivery fee and fixture tax on each valid order. A charge described as a membership fee requires investigation because this corpus contains no authority for such a fee.

The program offers convenient repetition, not a guarantee that every item will always be available or maintain the same catalogue price. Product availability, price notices and cancellation rights are governed by the specific clauses below. A historical shipment does not prove that a later cycle was validly authorized or delivered.

MP-AUTO-02. Enrolment and recurring consent

The customer affirmatively selects Repeat Delivery, chooses eligible items and quantities, confirms a schedule, identifies a payment route and accepts the displayed recurring terms. A preselected checkbox or account creation alone is not sufficient consent in this synthetic program.

MaplePaw retains the enrolment event, schedule ID, item selection, frequency, next scheduled dispatch instant, payment token reference, policy version and displayed consent text. It provides an enrolment confirmation. The confirmation must distinguish the first one-time or immediate order from subsequent recurring orders.

Recurring consent authorizes only cycles created according to the selected schedule and the price and change rules in this policy. It does not authorize unrelated products, membership charges, unapproved substitutions or repeated collection for an already paid cycle. If consent evidence is absent or the customer denies authorization, MP-PAY-04 requires human review.

MP-AUTO-03. Schedule, processing boundary and time calculation

Customers can choose a recurrence interval of two, four, six or eight weeks for eligible products. The selected next dispatch is represented as an exact instant, stored in UTC and displayed with the customer's local time zone. After a normal cycle, the next scheduled dispatch advances by the selected interval.

For this test program, processing begins exactly 48 elapsed hours before the scheduled dispatch instant. That processing-start instant is the cutoff for self-service changes to the current cycle. A change is timely only when the system records it strictly before processing starts. An event at the exact boundary is treated as after processing begins.

For example, a dispatch scheduled for 2026-10-15T16:00:00Z has a processing cutoff of 2026-10-13T16:00:00Z. This is an elapsed-hour calculation, not an instruction to subtract two local calendar dates. Daylight-saving changes must not alter the intended 48-hour interval.

The warehouse may dispatch later than planned. The recorded cutoff is not retroactively moved merely to make an earlier cancellation appear late. If MaplePaw changes the planned

dispatch in advance, it records the new schedule and applies MP-AUTO-04 notice and MP-AUTO-09 change rules.

MP-AUTO-04. Upcoming-order notice

MaplePaw targets an upcoming-order notice 72 elapsed hours before scheduled dispatch. The notice identifies schedule ID, cycle, items, quantities, current prices, discounts, tax assumption, delivery fee, store-credit allocation, external payable amount, scheduled dispatch and the exact current-cycle change cutoff.

This timing ordinarily gives a 24-hour period between the reminder and the 48-hour processing boundary. The notice also provides a cancellation or skip path. A message saying only your order is coming soon is not a sufficient price notice for an increased total.

MaplePaw retains the notice contents, send event and delivery status where available. A send record proves attempted sending, not that the customer read the notice. If no notice record exists, the system cannot claim the notice was received. If the notice was not sent or omitted material information, the affected cycle requires human review under MP-AUTO-12.

MP-AUTO-05. Prices, discounts and authorized cycle totals

Eligible recurring product lines receive a fictional five-percent discount from the disclosed cycle item price. The discount is rounded to two decimal places per line. Product lines not eligible for the discount are identified before enrolment and in the cycle notice. No introductory discount or separate loyalty fee exists in version 1.0.

The upcoming-order notice sets the maximum external amount MaplePaw may collect for that cycle unless the customer affirmatively approves a later change. A lower corrected price may reduce the charge. A higher item price, tax calculation or delivery amount must not silently exceed the disclosed cycle ceiling.

If a higher total is necessary after the notice, MaplePaw obtains fresh approval or skips the affected cycle and informs the customer. An increase is not authorized merely because catalogue prices fluctuate. A later notice with insufficient time for a meaningful response requires human review.

Store credit applied before capture reduces the external funding amount. If credit becomes unavailable after the notice and would increase the external amount above the disclosed ceiling, the merchant seeks approval or stops the cycle. It does not automatically transfer the shortfall to the external payment route.

MP-AUTO-06. Payment authorization and capture

At processing start, MaplePaw may request a funding authorization for the current disclosed cycle amount. A pending authorization is not a posted purchase. Capture occurs for shipped allocations under MP-PAY-02, normally at dispatch. The notice, order creation, authorization and capture timestamps are preserved independently.

A validly created cycle may have multiple shipment captures, but the total collected amount cannot exceed its authorized ceiling or duplicate an item allocation. A scheduled dispatch alone does not prove the items actually shipped. Staff reconcile the cycle with its order, packages and provider operations.

MaplePaw uses the selected payment route. It does not automatically try another saved card or wallet unless the customer separately opted into that specific backup method and the opt-in record remains valid. General possession of multiple saved payment methods is not backup-payment consent.

If funding fails, MaplePaw informs the customer and pauses the unpaid cycle. A safe retry uses current consent and verified operation status; repeated unknown-result attempts are not allowed. MP-PAY-14 governs timeout and duplicate-prevention procedures.

MP-AUTO-07. Cancelling the schedule and the current order

A customer can cancel future recurring cycles through the account portal or support. Successful cancellation records the schedule ID, request source and exact event time and sends a confirmation. Cancelling the schedule prevents creation of future cycles after that event.

If cancellation is recorded strictly before the current cycle's processing start, MaplePaw cancels that upcoming cycle as well. No new capture should be created for that cancelled cycle. If an authorization had already been placed erroneously, it is voided where supported; any incorrect capture is reviewed for refund.

If cancellation occurs at or after processing start, the schedule is still cancelled for future cycles, but the already-created current order is not automatically cancelled. Support checks whether it can still stop fulfilment. The customer is told the current order ID and stop outcome rather than a vague confirmation.

A cancellation event does not by itself establish that a later charge was improper. The investigation compares cycle creation, cutoff, cancellation, capture, notice, consent and actual fulfilment. Equally, the merchant cannot justify a new later cycle simply because a previous order was already processing.

MP-AUTO-08. Skipping, pausing and resuming

Skip shipment suppresses one specified upcoming cycle when requested before its processing boundary. The schedule remains active and the next cycle advances by the existing recurrence interval. The confirmation states which cycle was skipped and the next dispatch instant.

Pause prevents future cycle creation until the customer affirmatively resumes. Resume supplies the next dispatch, items, current amount and a new notice if required. The merchant does not create catch-up orders for skipped or paused cycles without fresh customer agreement.

Cancelling a schedule is different from skipping a cycle or pausing. Support checks the actual event rather than inferring cancellation from an empty shopping cart or removed marketing preference. An unsubscribe-from-email event does not cancel recurring orders, although MaplePaw should explain the correct path when contacted.

MP-AUTO-09. Changing dates, quantities and products

Before the current-cycle cutoff, customers may change the next dispatch, eligible quantities, items, address and payment route. The system records the old and new values and displays the revised total before confirmation. A quantity increase is not effective without customer confirmation of its financial effect.

A change to recurrence frequency applies after the next scheduled cycle unless the customer also changes that cycle's next dispatch. The confirmation must state this distinction. The interface should not imply that changing from four to eight weeks automatically moves an already scheduled next order.

If the merchant advances a dispatch, it must obtain customer approval when the change would reduce the promised notice or cancellation opportunity. It cannot shorten a cutoff retroactively. A postponement is communicated and should not create a second cycle for the same scheduled purchase.

After processing begins, support may request a warehouse change but cannot guarantee success. It records whether the requested change was actually applied. A support note requesting fewer units is not proof that the order total or shipment contents changed.

MP-AUTO-10. Out-of-stock items and substitutions

Unavailable products may be omitted from the current cycle or the cycle may be skipped, with notice and payment adjustment. MaplePaw does not replace one formula, brand or size with another without affirmative consent, even if the proposed product is thought to be equivalent.

If only part of the cycle can ship, the capture matches the shipped allocation and remains below the disclosed ceiling. MaplePaw does not add another standard delivery fee because it split or delayed its own fulfilment. The ordinary standard fee rule is MP-DEL-02.

Backordered goods are not silently moved into a paid surprise order. A later shipment requires a clear linked allocation or a newly approved order. If repeated stock issues require ending the schedule, MaplePaw confirms that future cycles have stopped and separately reconciles any already-created orders.

MP-AUTO-11. Physical goods, returns and delivery claims

Repeat Delivery products use the same product, delivery and satisfaction return rules as one-time purchases. MP-RET-02 provides the 180-calendar-day report window for eligible satisfaction returns. A product is not categorically non-returnable just because it was supplied through a recurring schedule.

A validly created recurring order can still be lost, damaged, incomplete or materially different from its description. Staff apply MP-DEL and MP-RET to those facts. Valid recurring consent does not establish successful delivery or accurate contents.

Returning one cycle does not automatically cancel the schedule. Cancelling the schedule does not automatically return earlier validly shipped goods. Support asks whether the customer wants both actions and records them separately. A refund confirmation should not imply that all future charges are stopped unless the schedule cancellation is verified.

MP-AUTO-12. Cancelled recurring billing complaint investigation

A CANCELED_RECURRING_BILLING complaint requires the schedule ID, consent record, current cycle and order ID, scheduled dispatch, processing cutoff, cancellation event, notice snapshot, authorization record, capture record and any fulfilled allocation. Customer emails, chat requests and portal events may help establish the cancellation request.

If a cycle was created after a successful schedule cancellation, MaplePaw treats that new cycle as an unauthorized merchant scheduling error and corrects any collected payment after MP-PAY-10 reconciliation. Staff attempt to stop unfulfilled goods. The case is not excused by the customer having enrolled months earlier.

If cancellation was timely for the upcoming cycle but the merchant still processed it, the affected capture is a merchant error. If cancellation was after processing start and the current order could not be stopped, the capture may relate to a valid existing order, provided notice, consent, amount and fulfilment are supported. Support explains the distinction and offers the ordinary return path where applicable.

Missing cancellation timestamps, conflicting support promises, absent consent, a deficient cycle notice or a charge above the notice ceiling require human review. The system must not automatically side with the merchant merely because its schedule database currently shows an active status.

MP-AUTO-13. Confirmation errors and delayed support handling

A request sent to the designated support channel before cutoff is treated as timely if its recorded receipt time is reliable, even when an agent handles it later. An internal support backlog should not turn a timely cancellation into a late one. Staff preserve the message receipt event.

If support explicitly confirmed cancellation but the backend did not apply it, the customer-facing confirmation must be investigated as a possible merchant error. Staff do not rely exclusively on a missing portal event to reject the claim. The confirmation, affected schedule and current-cycle wording matter.

A message asking a general question about cancellation is not necessarily a completed cancellation instruction. Staff assess its wording and request clarification where ambiguous. They should not invent a cancellation event or disregard an unambiguous instruction solely because the customer used email instead of the portal.

MP-AUTO-14. Record retention and review access

MaplePaw retains a chronological history of enrolment, item changes, notices, cycle creation, processing boundaries, pauses, skips, cancellations, funding operations and shipment events. Changing the current schedule row must not erase prior states used to assess a disputed cycle.

The customer can request a plain-language explanation of the cycle and cancellation history. Exported records omit full payment credentials and unrelated personal information. A payment-token reference is identified as a token reference, not presented as a card number or proof of consent.

When a test case supplies only the final schedule state, a model should request event history instead of reconstructing events from assumptions. A date without a timezone may be insufficient to decide a boundary case. The recorded source and confidence should accompany every extracted cancellation time.

MP-AUTO-15. Policy changes and program termination

This dataset is version 1.0 and its rules remain fixed for evaluation. A future program change must be a new version with a clear effective date, retained customer notice and a record of whether additional consent was required. Older disputes use the version and notices relevant to the disputed cycle.

MaplePaw may stop offering a product or end a schedule, with confirmation that future cycles will not be created. Terminating a schedule does not settle earlier payment, delivery or refund issues. Any outstanding current order is separately reconciled.

No term here promises that an external provider will decide a recurring-billing dispute in the merchant's favour. External evidence requirements and response deadlines must be checked independently. MaplePaw's notice and cutoff records are relevant merchant facts, not universal provider rules.

MP-AUTO-16. Timeline examples

Example A: Scheduled dispatch is 2026-10-15T16:00:00Z. Processing begins on 2026-10-13 at 16:00Z. Cancellation received at 15:59Z on October 13 is timely for the current cycle; a later capture for that cancelled cycle requires merchant-error correction.

Example B: The same schedule is cancelled at 16:01Z on October 13 after its current order was created at processing start. Future cycles stop. Staff investigate whether the current order was stopped and whether its amount, notice and fulfilment are valid before deciding whether the October 15 capture was wrong.

Example C: Cancellation occurred on October 13, yet a new November cycle was created and captured. The existing-order explanation for October cannot authorize November. MP-AUTO-12 supports correcting the new-cycle error.

Example D: The upcoming notice disclosed CAD 90.00 external payment, but the later catalogue increased and a CAD 95.00 capture was submitted without approval. MP-AUTO-05 and MP-PAY-08 identify an excess-amount issue even if the recurring schedule itself remained active.

Example E: The customer sent a clear cancellation email at 15:30Z before cutoff, and staff first read it at 18:00Z. With a reliable receipt record, MP-AUTO-13 uses 15:30Z. The human handling delay does not make the instruction late.
